# AS - 05 - Test Summary

**Project:** AbleSpace
**Environment:** Staging - https://staging.ablespace.io
**Test Date:** 20 October 2026
**Testing Type:** Manual Functional, Exploratory, UI and Compatibility Testing
**Primary Browser:** Google Chrome on Windows 11

## 1. Testing Overview

Manual testing was performed on the AbleSpace staging application to evaluate its core functionality, input validation, navigation, error handling, and user interface behavior.

Testing focused on authentication, student record creation, data filtering, data logging, browser navigation, and text scaling. Exploratory testing was also used to identify unexpected behavior and potential defects.

## 2. Test Coverage

The following areas were covered:

2.1. **Authentication:** Successful login, incorrect password handling, repeated failed login attempts, and access before email verification.
2.2. **Student Management:** Creating student records and checking name-field validation.
2.3. **Form Validation:** Testing unusual date values, invisible characters, and special-character-only names.
2.4. **Data Management:** Filtering student records and testing valid and negative data inputs.
2.5. **Navigation:** Checking browser Back behavior and consistency between the URL and displayed content.
2.6. **User Interface:** Evaluating layout behavior with the largest text-size setting.
2.7. **Compatibility:** Reviewing browser and device coverage using the compatibility matrix.

# 3. Key Findings

The following observations require attention or further verification:

- **3.1. Authentication Rate Limiting:** Repeated incorrect login attempts triggered a Firebase auth/too-many-requests error. Subsequent valid login attempts were also temporarily blocked.
- **3.2. Email Verification:** The dashboard was accessible before email verification. The expected access policy needs confirmation.
- **3.3. Input Validation:** Invisible characters and special-character-only names were accepted. Date-field constraints also require verification against the product requirements.
- **3.4. Navigation Consistency:** Using browser Back changed the URL from /caseload to /calendar, while the View Data panel remained visible.
- **3.5. Text Scaling:** At the largest text setting, the IEP Due date was partially clipped and the student name was truncated in the Caseload table.

These are recorded as observations or potential defects until the applicable requirements and expected behavior are confirmed.

# 4. Test Results Summary

Login, student creation, data filtering, and data logging scenarios were exercised, with several successful outcomes observed. Additional scenarios revealed behavior requiring investigation.

A final numerical pass/fail summary should be calculated from the completed detailed test-case sheet. No final defect count is reported here because the findings have not all been confirmed as defects.

# 5. Testing Limitations

- **5.1.** Some input-validation rules and email-verification requirements were not available for confirmation.
- **5.2.** Complete end-to-end workflow coverage has not been established.
- **5.3.** Browser and mobile compatibility results should reflect only tests actually executed on each environment.
- **5.4.** Persistence after refresh or re-login, session expiry, and additional responsive-layout scenarios require further testing.

# 6. Recommended Next Steps

6.1. Confirm authentication, email-verification, and input-validation requirements.
6.2. Reproduce and document the navigation and text-scaling issues.
6.3. Test student data persistence after refresh and re-login.
6.4. Expand browser and mobile testing, recording the actual browser versions and device details.
6.5. Retest potential defects after fixes and update the detailed test cases and bug reports.

# 7. Conclusion

The exploratory assessment verified several core application workflows and identified potential issues involving authentication rate limiting, input validation, navigation consistency, and text scaling. Further requirement clarification, targeted retesting, and broader compatibility testing are recommended before drawing conclusions about overall release readiness.
